PRIVATE PUSH-TO-TALK COMMUNICATION

Communication for the people who run the property

Security, engineering, maintenance and management on one channel — on the phones your staff already carry, and on radios where radios make sense.

RUNS OVER LTE AND WI-FI

SERVER CAN SIT ON YOUR SIDE

MANY SITES, ONE SYSTEM

THE PROBLEM

People are spread out, decisions cannot wait

On any working property several services operate at once, scattered across the grounds: a guard at the gate, an engineer in the plant room, housekeeping on the floors, the manager in the office.

A phone call does not solve this — you need the number, you wait for an answer, then you repeat yourself to the second and third person. A handheld radio works on one site but runs out of range and never links two properties together.

WHAT GETS IN THE WAY

Range

Analogue radio stops at the property line. Between two sites there is simply no link.

WHAT GETS IN THE WAY

Fragmentation

Every site has its own radios and its own frequencies. Management has no shared picture.

WHAT GETS IN THE WAY

Nights and weekends

With nobody at the desk, an incident is discovered in the morning — by its consequences.

THE SYSTEM

Push-to-talk over cellular and Wi-Fi

PRIVOX is press-and-speak communication carried over ordinary internet. Your voice reaches the whole group instantly — no number to dial, no waiting for anyone to pick up.

Distance stops being a factor: people in one group can be on different properties, in different cities and countries, and still hear each other as if they stood together.

Staff terminals reach the server over cellular or Wi-Fi. The dispatcher works in a browser — nothing to install.

The server can sit on your side. That is what separates PRIVOX from cloud radio services: conversations and data stay inside your perimeter, and the system does not depend on somebody else's subscription or somebody else's decisions. It can also be hosted by us — the choice is yours.

WHY IT MATTERS FOR A CONTRACTOR

Many properties, one system

A security or facility company does not serve one address — it serves a dozen: hotels, villa estates, construction sites, residential complexes. Usually each has its own radios, its own frequencies and no shared view at all.

In PRIVOX the properties live in one system without interfering with each other: each has its own groups and its own people, while management sees everything at once. A shift on one site does not hear the traffic of another — unless you deliberately create a shared channel for supervisors.

ON A SITE

Its own channels

Security, engineering, management — separate groups. Who listens and who speaks is your decision.

ACROSS SITES

One console

The duty operator sees every shift, the map of people and the alarms — on a single screen.

AS YOU GROW

A new site without new infrastructure

Adding a property means creating a group and handing out access, not buying and configuring equipment again.

LIFECYCLE

Communication is needed before the property opens

A construction site is already a team that needs to talk. And once it is handed over the property does not empty out: permanent staff arrive, and they need communication every day for the whole life of the building.

Construction

Site manager, perimeter security, engineers, contractors. Large grounds, many people, communication needed from day one.

TEMPORARY TEAM

Commissioning and handover

Operations services appear, acceptance work begins. Builders and future staff work side by side.

TRANSITION PERIOD

Operations

Security, engineering, maintenance, housekeeping, pool and grounds, property management.

PERMANENT TEAM – FOR THE WHOLE LIFE OF THE PROPERTY

The next properties

The company takes on a new address — the system already exists, one more site is added.

GROWTH WITHOUT STARTING OVER

WHAT SETS IT APART

The property joins the channel too

Besides people, sensors connect to the system: cold room temperature, leaks and flooding, the condition of technical rooms. An alarm lands in the same channel where the shift works, and is mirrored to a manager in Telegram.

A sensor connects without modifying the hardware — the server polls it through its normal interface. Each has its own limits: one set for a freezer, another for a plant room.

THRESHOLDS

Its own normal for each

A minimum, a maximum or both. Crossing the line raises the alarm immediately.

NO NOISE

One alarm, not two hundred

The signal fires at the moment a value crosses the threshold, not every fifteen seconds while the problem lasts.

THE IMPORTANT ONE

Silence is an alarm too

A sensor that stopped answering is more dangerous than one reporting bad numbers: a cold room may have been thawing for an hour while the screen still shows the last good temperature.

CONSOLE

The whole picture on one screen

The duty operator sees the channels of every site, the shift roster with who is reachable right now, the sensors and their state — and can speak into any group without joining it.

The dispatcher console. Channels on the left, then the site's sensors — one in alarm, two silent. On the right the shift: who is on air, with a call button for each person.

The shift on the map. Markers move with the people; the tooltip carries the callsign and speed. You can see who is closest to an incident.

Phones and radios on the same channel

A guard with a radio, a technician with a phone and a dispatcher at a desk sit in the same group and hear each other. No gateways, no adapters.

PHONE

An app for Android and iPhone. An incoming call wakes a phone in a pocket — even with the app closed.

RADIO

A hardware talk key, one-handed operation, works with gloves on. For the posts where a phone is awkward.

Which devices suit you is a conversation, not a package. In some places the phones people already carry are enough; at fixed posts a proper radio earns its keep. We match this to the property rather than selling one standard kit.

More than voice

Capability	What it is for on a property
Private call	A one-to-one conversation like a phone call, without occupying the shared channel.
Calling the shift	One button and every member's phone rings for real, even at night.
Emergency button	The signal crosses group boundaries and reaches the whole organisation.
Messages and photos	An address, a plate number, a picture of a fault — things you cannot pass by voice.
Member permissions	Who may speak, who only listens, who shares a position.
Access with an expiry	Seasonal staff and contractors get access until a date, and it lapses on its own.
Joining by QR	A person scans a card with the camera and is on air — no logins, no setup.

HOW TO START

A trial on one real property

Talking about communication is pointless until it has been used in the field. So we suggest starting with a trial deployment on one of your sites — with real people and a real shift.

Scope, duration and composition are matched to the property: how many people, which services, whether radios are needed. Afterwards we look at what only practice reveals — how the link holds inside real walls, how it moves between Wi-Fi and cellular, and whether people use it without being trained.

STEP 1

A conversation

We look at your properties and services: where communication breaks down today and what costs you most.

STEP 2

A live demonstration

We show the system working: voice, console, map, sensors. On your property if you prefer.

STEP 3

Trial deployment

One site, a real shift. Terms are agreed together — they depend on the scope.

GET IN TOUCH

Ready to show the system at work

ptt.privox@gmail.com

Write to us and we will arrange a demonstration — on your property or remotely. We will be straight about what the system does today and what is still ahead.
